

Attack rate and effective calibrated IHR by age group

Median [95% interval]. Attack rate = share of the age group infected over the 250-day season $(N - S(T) - SV(T)) / N$, including seeded infections, across the param-set stochastic runs. Effective IHR = $IHR_scale|age \times I_to_H_prop$ (unvaccinated) or $\times IV_to_H_prop$ (vaccinated), i.e. the probability that an infection is hospitalized, across the accepted MCMC draws.

7-age m(t), current vaccination data

age group	attack rate, baseline	attack rate, no vax	effective IHR, unvaccinated	effective IHR, vaccinated
0-0	4.8% [3.6-7.4]	10.1% [7.9-14.3]	1.077% [0.594-1.366]	0.982% [0.542-1.246]
1-4	5.3% [3.9-8.1]	12.2% [9.6-17.1]	1.086% [0.599-1.375]	0.990% [0.547-1.254]
